ARYAN SHARMA

Arizona | (928) 255-9458 | aryansharma.coms@gmail.com | LinkedIn | GitHub | Live Demo

SUMMARY

Software Engineer specializing in applied artificial intelligence, retrieval-augmented generation (RAG), and enterprise LLM pipelines. Combines a rigorous Computer Science foundation with full-stack engineering proficiency (Python, PostgreSQL, React, Node.js) to architect deterministic, low-latency intelligent systems that drive operational efficiency.

EDUCATION

B.S., Computer Science **12/2026**
Northern Arizona University *Flagstaff*

TECHNICAL SKILLS

Languages: Python, JavaScript, Java, SQL, C++
AI/ML: RAG, MCP, LLM APIs, pandas, NumPy, scikit-learn, PyTorch, TensorFlow, LangChain
Frameworks & Tools: React.js, Node.js, Express.js, MongoDB, REST APIs
Databases: MySQL, PostgreSQL
Cloud & DevOps: AWS, CI/CD, Docker, GitHub Actions

EXPERIENCE

Dupont Consulting **08/2022 - 10/2023**
Software Engineer Intern *Nashik, India*
- Architected scalable internal automation tools with Node.js, Express.js, and React.js, digitizing 5+ core operational workflows and cutting daily administrative processing time by 30%.
- Engineered and optimized relational schemas across PostgreSQL and MySQL, implementing strategic indexing and query refactoring to reduce query execution latency by 35% on high-volume records.
- Designed modular RESTful microservices and Python data pipelines to synchronize client records with real-time operational dashboards, deprecating manual data reconciliation and reducing entry overhead by 40%.

Spendor Audios **06/2025 - 08/2025**
AI Engineer Intern *London, UK*
- Architected an LLM-assisted documentation pipeline using the OpenAI API, few-shot prompting, and structured JSON outputs to parse hardware specification sheets, cutting manual content generation turnaround by 40%.
- Developed an end-to-end NLP sentiment pipeline in Python (pandas, scikit-learn) processing 10,000+ customer feedback records, categorizing hardware issues with 88% precision to expedite defect triage.
- Engineered backend REST APIs and ETL pipelines with Node.js, Express, and PostgreSQL to ingest 50k+ daily speaker calibration metrics, deprecating fragmented spreadsheets and cutting data consolidation latency by 60%.
- Designed and deployed responsive internal QA tooling using React.js and SQL dashboards, centralizing live audio testing metrics and improving cross-departmental inventory tracking accuracy by 25%.

PROJECTS

EvidenceTrace Live Demo
- Built and deployed an evidence-first RAG service for NIST AI-risk guidance with FastAPI, SQLite FTS5, AWS Lambda, and API Gateway; provides page-level citations, reviewable traces, and prompt-injection safeguard
- Implemented version-aware NIST ingestion, SQLite FTS5 retrieval, page-level citations, reviewable traces, and automated retrieval tests.

Automated Formal Verification Agent
SanDisk
- Ongoing
- Building a VS Code extension that takes plain English hardware specs and translates them into formal TLA+ logic models using an AI-powered agent.
- Designed a self-correction loop that runs the Java-based TLC Model Checker, reads its errors, and re-synthesizes the model until it terminates cleanly.

Product Catalog & Semantic Search GitHub
Spendor Audios
- Engineered a full-stack audio catalog with semantic search, embedding technical acoustic metadata and user listening queries via OpenAI APIs to match buyers to the optimal speaker model across 18 loudspeaker lines.
- Designed modular REST APIs and indexed schemas in PostgreSQL to manage 75+ active SKUs (veneer variants, driver specs, calibration curves), integrating client-side caching in React to cut catalog query latency by 35%.
